Report Date 2026-10-17 1639 UTC

Proposal Funds Allocation — Co-mingled Funds by Proposal

Purpose

The 9200 Safe and ETH Safe hold co-mingled funds from multiple DAO proposals. This sheet tracks how much of each asset still belongs to each proposal.

Proposal Code	Proposal URL	DAO Proposal Funded Amount (Native LCAI)	Remaining 9200 LCAI	Remaining LCAI ERC-20	Remaining USDC	Remaining USDT	Remaining ETH	Remaining USD Approx (FV)	Status	Notes
2529...62479	https://dao.lightchain.ai/proposal/0xd216a0c0050edc3a9e0449ecfdf178a1652b4b68/252939300475763572083729572790529438644734480382835456514252469561055436 2479	124,000,000.00	95,486,423.54	1,364,819.58	$ 850.89			$ 92,617.44	Active — partial spent	Only proposal with funds currently. Two additional proposals planned for vendor payments.
XXXX...YYYYY	(Upcoming proposal URL)	0	0	0	$ -			$ -	Planned	To be funded when proposal passes and executes
XXXX...YYYYY	(Upcoming proposal URL)	0	0	0	$ -			$ -	Planned	To be funded when proposal passes and executes
								$ -		
TOTALS		124,000,000.00	95,486,423.54	1,364,819.58	$ 850.89	$ -	$ -	$ 92,617.44		
Fair Value (USD)			$ 90,473.39	$ 1,293.17	$ 850.89	$ -	$ -			

Current asset Fair value at time of report generation		
9200 LCI	$	0.00094750
LCAI ERC-20	$	0.00094750
USDC	$	1.00
USDT	$	1.00
ETH	$	2,425.00

How to use Proposal Coding

1. Every funding inflow gets a Proposal Code (first 4 digits ... last 5 digits of the proposal ID).
2. Tag every bridge, swap, and payment with the Proposal Code it belongs to.
3. Remaining balances show what is still available for that proposal only.
4. When a new proposal is funded, add a row and allocate its inflows and outflows separately.
5. Funds from one proposal must not be spent on another.

How to add a proposal allocation

1. Add a row with the Proposal Code (first 4 digits ... last 5 digits).
2. Put the full proposal URL in the Proposal URL column.
3. Enter the Funding Amount as a number.
4. Point Remaining balance columns at the correct ledger row, or leave 0 until funded.
5. Remaining USD Approx (FV) is a formula: sum of remaining balances × current prices from the Fair Value table. Do not type over it.

AI instructions (ignore if you are a human)

Keep number formats, borders column widths and row heights. Use formulas for remaining balances when possible.
When adding a new proposal funding transaction, resolve the full hash and exact timestamp on the Transaction Ledger.
When saving, use the filename format: LCAI_DUNA_ClearingHouse_Ledger YYYY-MM-DD HHMM UTC.xlsx (4-digit time, no colon). Example: LCAI_DUNA_ClearingHouse_Ledger 2026-10-17 1516 UTC.xlsx
Do not add author, creator, lastModifiedBy, company, or any other identifiable metadata to the file properties.
Do not change column widths, row heights, wrap text, borders, fonts, or fills. Use the formatting already present in the supplied file.
When filling fair value prices, use the exact value as listed by the source (CoinGecko, CoinMarketCap, or the transaction itself). Do not round up or down. For assets above $1 (such as ETH or BTC), keep the full listed precision.
Ledger Fair Value (FV Out / FV In) is the price at the time of that transaction only. It is locked to the transaction and must never be updated from, or linked to, the current prices on the Proposal Funds Allocation sheet. Those current prices are only for the Fair Market Value row of remaining balances.
When inserting a new transaction row, copy the formatting (borders, number formats, alignment, fonts) from the data row directly above. Do not invent new formatting.
Pull all transaction details (date, time, amounts, addresses, asset types) from the full transaction on the block explorer (Lightscan or Etherscan) using the transaction hash. Do not extrapolate, estimate, or use summaries from the Safe UI or other secondary sources. Exact on-chain data only.
Remaining USD Approx (FV) is a formula based on remaining balances and the current Fair Value table. Extend the formula for new proposal rows. Do not hardcode it. Do not change column widths, row heights, wrap, borders, fonts, fills, or alignment.

Ledger ID	Date (UTC)	Stage	Proposal Code	Description	Chain	From Address	To Address	Asset Out	Amount Out	Fee Token (FX Dec table)	USD Out	Asset In	Amount In	Fee token (FX to USD)	USD In	Net USD	To Yearly CSV	Debit Account	Credit Account	Amount Reference	Amount Reference	USD	Notes

How to add a transaction

1. Insert a new row at the bottom of the data.

2. Assign the next ledger ID (6508, 6509, ...).
3. Only add GUSD fund movements (Funding, Bridge, Swap, Payment). ProfitLoss gas goes on the Signer Fees. sheet. Keep each swap on one row. Fill Fx for both the asset sold and the asset received.
4. Copy the transaction hash from Etherscan.
5. Add the sender ID and receiver link on the Verification Links.
6. If there is a fee or, amount to record, add it on Trading Fees and Gas.

All transactions. Ensure if you are a human!
Preserve headers, header ID, and number formats. Do not hardcode balances.
Do not overwrite existing transactions. Append new rows only.
Keep column widths and row heights. Use formulas for any balances.
Keep column widths and row heights. Use formulas for remaining balances when possible.
Always monitor the full transaction hash IDs. // Increase row size. Do not leave Tx Hash / UID blank.
Always include the exact date and time (UTC) from the block explorer. Do not use approximate dates.
Always use the exact timestamp from the block explorer. Format: YYYY-MM-DD HH:MM:SS. Example: For 14 short time: no color), Example: UCA1: 15/Mall. Chinatown/house: (where 2026-10-17 15:56 UTC.xlsx
Do not add author, version, build/modification, summary, or any other identifiable metadata to the file anywhere.
Enter FX Out (USD) and FX In (USD) as the price per unit at the timestamp. USD Out = Amount Out × FX Out. USD In = Amount In × FX In. Net USD = USD In − USD Out. Do not use a single USD figure as them.
Fee Token and Fee (FX to USD) are for gas only. Gas is paid in ETH. Fee (FX to USD) = Fee × ETH price at that time.
Ledger Fee Value (FX Out, FX In) is the price at the time of that transaction only. It is locked to the transaction and must never be updated from, or linked to, the current prices on the Proposal Funds. Allocation sheet. These current prices are only for the Fair Market Value row of remaining balances.
When inserting a new transaction row, copy the formatting (borders, number formats, alignment, fonts) from the above row exactly above. do not insert rows/formatting.
Pull all transaction details (date, time, amounts, addresses, asset types) from the full transaction on the block explorer (Lighscan or Etherscan) using the transaction hash. do not extrapolate, estimate, or use summaries from the light UI or other secondary sources. Exact on-chain data only.
Fair value prices use the exact values listed by the source. Do not round. For assets above $1 (ETH, WBTC, etc.), keep the full listed precision.

Trading Fees and Gas						
Gas & Fees						
Stage	**Fee Type**	**Amount**	**Asset**	**USD Approx**	**Paid By**	**Ledger ID**
CoW PreSign	ETH gas	0.00	ETH	$ 0.04	Executor (owner)	Signer Fees
CoW Settlement	Solver surplus	109.70	USDC	$ 109.70	Retained by solver	E003
USDC Payment	ETH gas	0.00	ETH	$ 0.02	Executor	E004
CoW PreSign	ETH gas	0.00	ETH	$ 0.02	Executor	Signer Fees
CoW Settlement	Solver surplus	75.07	USDC	$ 75.07	Retained by solver	E006
USDC Payment	ETH gas	0.00	ETH	$ 0.01	Executor	E007
TOTALS				$ 184.86		

How to add a trading fee or gas entry

1. Add a row in the Gas & Fees section.
2. Put pure numbers in Amount and USD Approx. No text in those cells.
3. Put the matching Ledger ID (or "Signer Fees" for PreSign gas) in the Ledger ID column.
4. Only total the USD Approx column. Do not total mixed asset amounts.

AI instructions (ignore if you are a human)

Numbers and text must stay in separate columns. Only sum the USD Approx column.

Do not track slippage. Only record amounts actually paid or received.

Keep number formats, borders, column widths, and row heights. Do not add formatting that makes cells paste as a PNG.

When a fee has an on-chain transaction, include the full hash on the Transaction Ledger or Verification Links. Do not leave it blank.

When saving, use the filename format: LCAI_DUNA_ClearingHouse_Ledger YYYY-MM-DD HHMM UTC.xlsx (4-digit time, no colon). Example: LCAI_DUNA_ClearingHouse_Ledger 2026-10-17 1516 UTC.xlsx

Do not add author, creator, lastModifiedBy, company, or any other identifiable metadata to the file properties.

Do not change column widths, row heights, wrap text, borders, fonts, or fills. Use the formatting already present in the supplied file.

Ledger Fair Value (FV Out / FV In) is the price at the time of that transaction only. It is locked to the transaction and must never be updated from, or linked to, the current prices on the Proposal Funds Allocation sheet. Those current prices are only for the Fair Market Value row of remaining balances.

When inserting a new transaction row, copy the formatting (borders, number formats, alignment, fonts) from the data row directly above. Do not invent new formatting.

Pull all transaction details (date, time, amounts, addresses, asset types) from the full transaction on the block explorer (Lightscan or Etherscan) using the transaction hash. Do not extrapolate, estimate, or use summaries from the Safe UI or other secondary sources. Exact on-chain data only.

Fair value prices: use the exact value as listed by the source. Do not round. For assets above $1 (ETH, BTC, etc.), keep the full listed precision.

Signer Fees — Gas Paid by Executors

Purpose

Tracks ETH gas paid by Safe owners/executors for PreSign and other transactions. These are not DUNA funds. If the DUNA later reimburses an executor, record the payment on the Transaction Ledger and reduce the running

Date (UTC)	Executor	Stage	Tx Hash	Gas (ETH)	USD Approx	Running Total (ETH)	Running Total (USD)	Notes
2026-10-12 02:10:11	0x999C3EB1c01f296cd91d5fE58a31262C0beCE4fd	PreSign	0x293f6804dd8fcfb99f21d322610298b7d16786580d575117de8eca38579e4851	0.000016	0.04	0.000016	0.04	CoW PreSign cycle 1
2026-10-14 01:57:59	0x92dB88339d8699cc8972Eb2a72Be033646d79267	PreSign	0x0ac1ebbcc25c18d8d2262d659765da4795bc0d2295e9ad9b228bfdd35ee7b396	0.000007	0.02	0.000023	0.06	CoW PreSign cycle 2

Running Total by Executor

Executor	Total Gas (ETH)	Total USD	Notes
0x999C3EB1c01f296cd91d5fE58a31262C0beCE4fd	0.04	0.000016	
0x92dB88339d8699cc8972Eb2a72Be033646d79267	0.02	0.000023	

How to add a signer fee

1. Add a row with Date, Executor, Stage, Tx Hash, Gas (ETH), and USD Approx.
2. Extend the running total formulas.
3. Update the per-executor summary.
4. If the DUNA reimburses the executor, record the payment on the Transaction Ledger and note it here.

AI instructions (ignore if you are a human)

Do not change column widths, row heights, or wrap settings. Keep numbers in their own cells. Use formulas for running totals.

Always resolve the full transaction hash (0x...) for every new row. Do not leave Tx Hash / UID blank.

Always include the exact date and time (UTC) from the block explorer. Do not use approximate dates.

When saving, use the filename format: LCAI_DUNA_ClearingHouse_Ledger YYYY-MM-DD HHMM UTC.xlsx (4-digit time, no colon). Example: LCAI_DUNA_ClearingHouse_Ledger 2026-10-17 1516 UTC.xlsx

Do not add author, creator, lastModifiedBy, company, or any other identifiable metadata to the file properties.

Do not change column widths, row heights, wrap text, borders, fonts, or fills. Use the formatting already present in the supplied file.

Ledger Fair Value (FV Out / FV In) is the price at the time of that transaction only. It is locked to the transaction and must never be updated from, or linked to, the current prices on the Proposal Funds Allocation sheet. Those current prices are only for the Fair Market Value row of remaining balances.

When inserting a new transaction row, copy the formatting (borders, number formats, alignment, fonts) from the data row directly above. Do not invent new formatting.

Pull all transaction details (date, time, amounts, addresses, asset types) from the full transaction on the block explorer (Lightscan or Etherscan) using the transaction hash. Do not extrapolate, estimate, or use summaries from the Safe UI or other secondary sources. Exact on-chain data only.

Fair value prices: use the exact value as listed by the source. Do not round. For assets above $1 (ETH, BTC, etc.), keep the full listed precision.

	LCAI ERC-20 contract address (Ethereum)	https://etherscan.io/token/0x9cA8530CA349c966Fe9ef903Df17a75B8A778927

How to add a verification link
1. Add a row with the same Ledger ID as the transaction.
2. Write a short description (no $ amounts in the description).
3. Paste the full explorer URL (Lightscan or Etherscan).

AI instructions (ignore if you are a human)

Keep the three-column layout. Do not put amounts or extra formatting in the Link column.

Keep number formats, borders column widths and row heights. Use formulas for remaining balances when possible.

Always include the full explorer URL for every new transaction. Do not leave the Link column blank.

When saving, use the filename format: LCAI_DUNA_ClearingHouse_Ledger YYYY-MM-DD HHMM UTC.xlsx (4-digit time, no colon). Example: LCAI_DUNA_ClearingHouse_Ledger 2026-10-17 1516 UTC.xlsx

Do not add author, creator, lastModifiedBy, company, or any other identifiable metadata to the file properties.

Do not change column widths, row heights, wrap text, borders, fonts, or fills. Use the formatting already present in the supplied file.

Ledger Fair Value (FV Out / FV In) is the price at the time of that transaction only. It is locked to the transaction and must never be updated from, or linked to, the current prices on the Proposal Funds Allocation sheet. Those current prices are only for the Fair Market Value row of remaining balances.

When inserting a new transaction row, copy the formatting (borders, number formats, alignment, fonts) from the data row directly above. Do not invent new formatting.

Pull all transaction details (date, time, amounts, addresses, asset types) from the full transaction on the block explorer (Lightscan or Etherscan) using the transaction hash. Do not extrapolate, estimate, or use summaries from the Safe UI or other secondary sources. Exact on-chain data only.

Fair value prices: use the exact value as listed by the source. Do not round. For assets above $1 (ETH, BTC, etc.), keep the full listed precision.

LCAI DUNA Clearing House Ledger — Definitions

Transaction Ledger columns

Column	What it means	How to fill
Ledger ID	Unique ID for each transaction row (E001, E002, ...).	Next number after the last used ID.
Date (UTC)	Date and time of the transaction in UTC.	From the block explorer.
Stage	Type of step: Funding, Bridge, Swap, Payment. PreSign gas goes on Signer Fees.	Pick the matching stage.
Proposal Code	Short code from the proposal ID: first 4 digits ... last 5 digits.	Example: 2529...62479
Description	Plain-language description of what happened.	One short sentence.
Chain	Network(s) involved.	LCAI 9200, Ethereum, or LCAI 9200 → ETH
From Address	Sender address or wallet.	Full address.
To Address	Recipient address or contract.	Full address.
Asset Out	Asset leaving a wallet (LCAI or USDC).	Leave blank if none.
Amount Out	Numeric amount leaving. Numbers only.	No text in this cell.
Asset In	Asset arriving (LCAI or USDC).	Leave blank if none.
Amount In	Numeric amount arriving. Numbers only.	No text in this cell.
FV Out (USD) / FV In (USD)	USD price per unit of the asset going out or coming in, at the transaction timestamp.	Exact value as listed by the source at the transaction timestamp. Do not round. Never update from the
USD Out / USD In	Fair-value total for that side. Formula: Amount × FV.	Formula — do not type over.
Net USD	USD In minus USD Out. Shows the net fair-value change for the row.	Formula — do not type over.
Tx Hash / UID	On-chain transaction hash (0x...).	From Lightscan or Etherscan.
Debit Account	Accounting debit account.	Example: Assets:9200-ClearingHouse:LCAI
Credit Account	Accounting credit account.	Example: Assets:ETH-ClearingHouse:LCAI
Notes	Extra detail (gas, surplus, exact amount).	Optional.
9200 LCAI	Running balance of native LCAI in the 9200 Safe.	Formula — do not type over.
LCAI ERC-20	Running balance of bridged LCAI in the ETH Safe.	Formula — do not type over.
USDC	Running balance of USDC in the ETH Safe.	Formula — do not type over.
Proposal Notes	Notes specific to the proposal.	Optional.

Other sheets

Proposal Code (Proposal Funds Allocation)	Same short code as on the ledger (first4...last5).	Must match the Proposal Code column.
Proposal URL	Full URL of the DAO proposal.	From dao.lightchain.ai
Funding Amount (Native LCAI)	Amount of 9200 LCAI sent into the Safe by the proposal.	Number only.
Remaining 9200 LCAI / LCAI ERC-20 / USDC	Balances still attributable to that proposal.	Usually a formula pointing at the ledger.
Remaining USD Approx (FV)	Approximate USD value of that proposal's remaining balances at current fair value.	Formula — do not type over. Uses the current Fair Value table.
Ledger ID (Fees & Verification)	Points back to the matching row on the Transaction Ledger.	Use the Ledger ID from that row.
Amount / USD Approx (Trading Fees and Gas)	Pure numbers. Only the USD Approx column is totaled.	Never mix text and numbers in the same cell.
USD Approx / Approx USD	Money values.	Use accounting number format.

Proposal Funds Allocation sheet

Tracks co-mingled funds by proposal so money approved under one proposal is not spent on another. Used when setting up payments and for community/accountant reporting.

1. Add a new row on the Transaction Ledger with the next Ledger ID (E010, E011, ...).

Trading Fees and Gas sheet

Records gas and trading-related fees. Only the USD Approx column is totaled. Slippage is not tracked. PreSign gas is noted as Signer Fees.

4. Extend the running-balance formulas (9200 LCAI, LCAI ERC-20, USDC) to the new row.
5. Add a matching row on Verification Links with the same Ledger ID and the explorer URL.
6. If there is a fee or gas amount, add a row on Trading Fees and Gas and put the Ledger ID in the last column.
7. If this is a new proposal, add a row on Proposal Funds Allocation with the short code and full URL.

AI instructions (ignore if you are a human)

Do not change fonts, fills, borders, or number formats unless asked.
Do not add rich text, images, or special encoding that makes cells paste as a PNG.
Keep numbers in their own cells. Never put text and numbers in the same cell.
When adding rows, copy the border and number format from the row above.
Update these instruction sections if you change the structure of any sheet.
Use formulas for running balances and totals. Do not hardcode calculated values.
Keep column widths and row heights. Use formulas for remaining balances when possible.
Always resolve the full transaction hash (0x...) for every new row. Do not leave Tx Hash / UID blank.
Always include the exact date and time (UTC) from the block explorer. Do not use approximate dates.
When saving, use the filename format: LCAI_DUNA_ClearingHouse_Ledger YYYY-MM-DD HHMM UTC.xlsx (4-digit time, no colon). Example: LCAI_DUNA_ClearingHouse_Ledger 2026-10-17 1516 UTC.xlsx
Do not add author, creator, lastModifiedBy, company, or any other identifiable metadata to the file properties.
Use FV Out/FV In and USD Out/USD In/Net USD. Do not recreate a single USD Approx column on the Transaction Ledger.
Do not change column widths, row heights, wrap text, borders, fonts, or fills. Use the formatting already present in the supplied file.
Swaps stay on one row with FV Out and FV In both filled. Do not split a swap into two rows.
When filling fair value prices, use the exact value as listed by the source (CoinGecko, CoinMarketCap, or the transaction itself). Do not round up or down. For assets above $1 (such as ETH or BTC), keep the full listed precision.
Ledger Fair Value (FV Out / FV In) is the price at the time of that transaction only. It is locked to the transaction and must never be updated from, or linked to, the current prices on the Proposal Funds Allocation sheet. Those current prices are only for the Fair Market Value row of remaining balances.
When inserting a new transaction row, copy the formatting (borders, number formats, alignment, fonts) from the data row directly above. Do not invent new formatting.
Pull all transaction details (date, time, amounts, addresses, asset types) from the full transaction on the block explorer (Lightscan or Etherscan) using the transaction hash. Do not extrapolate, estimate, or use summaries from the Safe UI or other secondary sources. Exact on-chain data only.
Remaining USD Approx (FV) is a formula based on remaining balances and the current Fair Value table. Extend the formula for new proposal rows. Do not hardcode it. Do not change column widths, row heights, wrap, borders, fonts, fills, or alignment.
