

Website Audit - Revised QA Edition

Full live-site, documentation, legal-copy and website-hygiene review. Updated after a second pass focused on stale exchange badges, contact details, old presale material, legacy pages, dead-end CTAs and front-end QA.

Snapshot: 28 September 2026. This replaces the first PDF. It deliberately separates confirmed live/crawable issues from visual/manual items that still require browser verification.

Primary objective: make the public web presence look like the September 2026 Lightchain network, not a mixture of presale 2024, testnet 2025/early-2026 and current mainnet material.

Bottom line

The largest problem is now clearly broader than the homepage. Lightchain has a modernized front page and current mainnet documentation, but legacy content remains spread across the homepage, legal pages, old blog/index pages, forum footer, dashboard, whitepaper and technical docs. A new visitor can encounter conflicting claims about whether LCAI is transferable, whether it is governance-only, whether the presale is still active, whether mainnet is live, which chain governance uses, what the current slot time is, and whether exchange listings are live or merely 'coming soon'.

This should be treated as a single content-governance cleanup, not a handful of copy edits.

REVISED VERSION - supersedes the earlier 28 September audit PDF

1. What Should Be Fixed First

Red-line items before any major marketing push: update Terms/Risk/Privacy pages, remove or verify every 'coming soon' exchange/product label, remove presale/referral/giveaway remnants that are no longer active, reconcile token utility/governance/ownership docs, and make all network facts current.

Rank	Area	Problem	Priority
1	Legal / risk pages	2024/presale-era language conflicts with live mainnet, transferability, token utility and current governance.	CRITICAL
2	Exchange / trade area	Homepage still exposes 'TRADE LCAI ON >> SOON'; manual QA also needs to verify/remove stale Kraken or other exchange badges.	CRITICAL
3	Token utility	Whitepaper/legal copy says governance-only; current docs/homepage describe AI-task/payment/network utility.	CRITICAL
4	Governance / ownership	Official docs disagree on Ethereum vs Lightchain governance and EOA vs Timelock ownership.	CRITICAL
5	Homepage stale content	Referral bonus, May 7 countdown, Testnet v2, expired-relative liquidity text, broken counters.	HIGH
6	Contact / support	Public legal pages have no contact email despite asking users to contact the project.	HIGH
7	Network parameters	Mainnet overview still says 6-second slots; validator docs say 2 seconds from 22 Sep 2026.	HIGH
8	Legacy indexed pages	Old presale blog copy and Win \$100K giveaway page remain searchable/indexed.	HIGH

2. Detailed Findings

CRITICAL

1. Terms and Conditions are still written for an active presale

Observed: The live Terms show an effective/revised date in 2024, define users as 'Participants', repeatedly refer to taking part in the LCAI presale, say payments must follow presale instructions and say purchased tokens will be delivered after the presale concludes.

Action: Have counsel replace or formally update the Terms for the current DUNA/mainnet ecosystem. Preserve old presale terms only as a dated historical archive if legally required. Do not leave future-tense presale delivery obligations as the current Terms.

CRITICAL

2. Risk Disclosures describe a different token/network than the live project

Observed: The live Risk page says LCAI operates on Ethereum, provides rights only for governance, uses a 1% governance quorum, is 'non transferable and cannot be resold', may trade on exchanges after the presale, and describes Token Sale proceeds. Those statements conflict with current mainnet, trading, governance and token-utility material.

Action: Urgent legal/technical rewrite. Every risk statement should be mapped to the deployed system, current governance parameters, actual token transferability and current legal structure. Keep strong risk language, but make the facts current.

CRITICAL

3. Token purpose is contradictory across official sources

Observed: The whitepaper and Terms/Risk material characterize LCAI as governance-only, while current tokenomics, worker docs and the homepage describe AI-task payments, participation, incentives and ecosystem interactions.

Action: Approve one canonical token-purpose statement with legal + protocol + governance owners. Reuse the exact approved language in homepage, docs, whitepaper v2, Terms, Risk, exchange/KOL briefs and FAQs.

CRITICAL

4. Homepage trade block is unfinished and routes incorrectly

Observed: The homepage exposes 'TRADE LCAI ON >> SOON'; the crawl resolves that CTA to the AI Chat route rather than a verified trading page.

Action: Replace with a verified trading/markets module or remove the block. Every market CTA should show only active, verified routes and the official LCAI contract.

CRITICAL

5. Exchange badges such as Kraken must not remain in indefinite 'coming soon' status

Observed: A manual visual check was specifically raised for a Kraken 'coming soon' badge. The crawler does not expose that badge as text, and current searches did not surface an official Kraken LCAI market page. The official May exchange update only said the Kraken process was ongoing.

Action: Visually inspect the rendered homepage on desktop/mobile and remove any Kraken or other CEX logo unless status is backed by an exchange-owned live market/listing announcement. If an application is merely pending, do not present the exchange logo as a near-certain listing.

CRITICAL

6. Governance docs describe incompatible current voting systems

Observed: One DAO guide says governance is on Ethereum using LCAI-Ballots and Lightchain deployment is future; another current permissions page says governance is entirely on Lightchain mainnet using NativeVotes.

Action: Create one canonical 'How governance works today' page. Mark old Ethereum voting material Legacy/Archived if it is no longer the active route.

CRITICAL

7. Protocol ownership / admin-control status is contradictory

Observed: Mainnet contract docs say five upgradeable protocol contracts remain owned by a protocol-owner EOA pending handover; permissions docs say the handover occurred at network launch and Timelock owns protocol-state contracts.

Action: Check live owner()/roles on-chain and publish one verified ownership table with block/date. Remove stale ownership claims immediately.

CRITICAL

8. Whitepaper remains a launch-era architecture document

Observed: The current PDF still contains future-looking phases and a governance-only token description that conflicts with deployed worker fees and current docs.

Action: Publish Whitepaper/Protocol Paper v2. Until then, place a clear 'Historical design paper' notice and direct readers to current docs/roadmap.

HIGH

9. Privacy Policy is presale-era and has no usable contact route

Observed: The Privacy Policy still talks about participating in the presale, processing token purchases, presale announcements and old analytics/advertising integrations. It tells users to reach out regarding privacy concerns but publishes no email address.

Action: Update data-processing facts and controller/legal-entity details, then add a monitored privacy/contact email. An official forum reply previously suggested team@lightchain.ai, but the team should verify that mailbox is still owned, monitored and appropriate before publishing it.

HIGH

10. No clear general contact email is presented on the main site

Observed: The current footer offers Discord support but no direct email. Legal/privacy pages also provide no email address, even where users may need to make formal requests.

Action: Add a Contact section with purpose-specific channels, e.g. general/team, privacy, security and media/partnerships. Only publish addresses that are monitored and have an owner/SLA.

HIGH

11. Homepage still contains a referral-bonus section

Observed: The live homepage includes 'Your referral link' and tells users to share it with friends to receive a bonus, despite the project being long past the original presale/referral phase.

Action: If no active referral program exists, remove it from the public homepage. If historical referral balances still matter, keep them inside a clearly labelled legacy dashboard rather than marketing them to new visitors.

HIGH

12. Dashboard still foregrounds referral rewards and purchase history

Observed: The indexed dashboard says 'Explore your transaction history, referral rewards and rank' and contains Purchase History alongside current mainnet/ETH balances.

Action: Decide whether this is still an active user function. If legacy-only, relabel 'Legacy Presale / Referral History' and separate it from current ecosystem actions.

HIGH

13. Win \$100K giveaway page is still indexed

Observed: A /join page remains searchable with 'Win \$100K' content months after the original giveaway window.

Action: If the giveaway is finished, return a dated results/archive page or redirect to a current community page. Do not leave an apparently live promotional landing page indexed.

HIGH

14. Old blog/index pages still actively advertise the presale

Observed: Indexed Lightchain blog/tag pages still answer 'What are the details of the presale?' in present tense and contain CTAs inviting visitors to join the presale and buy discounted tokens.

Action: Archive/noindex obsolete presale landing content or rewrite it as clearly dated historical material. Remove active purchase CTAs from historical articles.

HIGH

15. Community Signals is a stale time capsule

Observed: The homepage still says mainnet is scheduled for May 7, shows Testnet v2 material and uses relative wording about a 90-day liquidity re-lock 'starting today'.

Action: Replace the whole block with dated September updates from current announcements/X/GitHub. Never use 'today' in evergreen cards without an explicit date.

HIGH

16. Broken/empty homepage metrics remain visible

Observed: The crawl shows a real '300K+' transaction number beside bare K / \$ M / K placeholders for holders, market cap, liquidity, transfers, followers and Discord members.

Action: Use reliable server-side values with a 'last updated' timestamp, or hide the metric if the data call fails. A blank suffix should never be the fallback state.

HIGH

17. Mainnet slot-time documentation is stale

Observed: Mainnet Overview still states 6-second slots and 36-second epochs. The current validator guide says slot time changed to 2 seconds from slot 2,017,074 on 22 September 2026.

Action: Update Mainnet Overview and every network-parameter table. Prefer generating shared parameters from one source so validator docs, overview and explorers cannot drift.

HIGH

18. Mainnet genesis/public-launch dates need a single explanation

Observed: Technical docs record genesis on 5 May 2026; the public launch announcement on 8 May says mainnet was reached 'yesterday'; the homepage still carries a pre-launch May 7 countdown.

Action: Standardize: e.g. 'Genesis: 5 May 2026' plus 'public mainnet launch: 7 May 2026' if both milestones are intentional. Remove future-tense countdown language.

HIGH

19. Mainnet/testnet navigation is inconsistent

Observed: The homepage has mainnet explorer links but 'API References', footer API Docs and Contract Verifier routes still point at testnet in places.

Action: Default production-facing navigation to mainnet. Put all testnet tools in an explicit Testnet/Developer Lab section.

HIGH

20. 'External Wallet (soon)' and 'SDKs (soon)' need ownership or removal

Observed: Both labels appear in the current navigation across the homepage and legal pages. There is no visible date, owner or status attached.

Action: If still planned, link to a roadmap item/status page. If not actively scheduled, remove the nav item. 'Soon' without a date becomes permanent clutter.

HIGH

21. Worker/dispatcher status remains internally inconsistent

Observed: Current worker docs still describe dispatcher-routed mainnet and a switch planned for the week of 14 September, while roadmap material describes the gateway conversion/dispatcher retirement as done.

Action: Publish a one-line live status banner on every worker page: current assignment mode + last verified date. Archive superseded instructions.

HIGH

22. AIVM status is inconsistent

Observed: The homepage presents AIVM as an execution layer, while the FAQ calls it planned; worker/mainnet docs describe live AI inference mechanics.

Action: Use explicit labels: LIVE / BETA / TESTNET / IN DEVELOPMENT / PLANNED. Apply them consistently to AIVM, Pol, privacy inference and developer features.

HIGH

23. Worker Explorer can render a misleading empty state

Observed: The public crawl has shown 'No workers found' even though current docs and the ecosystem describe active worker infrastructure.

Action: Use server-rendered summary metrics and distinguish 'no workers' from 'data unavailable/loading/API failure'.

HIGH

24. DAO create page exposes zero-value fallback governance data

Observed: The public crawl has exposed total supply, proposal threshold, quorum and voting timings as zero/placeholder values.

Action: Server-render canonical defaults or show an explicit loading/connect-wallet state. Consider noindex for transactional create pages.

HIGH

25. Governance quorum display needs explanation

Observed: One governance page presents 3% quorum as 298,989,450 LCAI while the fixed total supply is stated as 10B, where 3% would be 300M.

Action: Explain the exact denominator: checkpointed voting supply, delegated supply or another contract value. Do not label it simply as 3% of total supply unless that is exactly true.

HIGH

26. Current legal pages do not reflect the DUNA structure

Observed: Terms/Risk pages use generic 'Company' / 'Lightchain' language and do not mention the current Wyoming DUNA framework even though the DUNA agreement was later ratified and governs DAO operations.

Action: Have counsel determine the correct contracting/data-controller/governance entity language and update the legal pages accordingly. This is a legal-review item, not a copywriter guess.

MEDIUM

27. CoinGecko is named but not surfaced consistently

Observed: The FAQ says users can track LCAI on CoinMarketCap and CoinGecko, while the visible footer/social list includes CoinMarketCap but not an obvious CoinGecko link.

Action: Add verified CMC and CoinGecko tracker links together, or remove unsupported references. Keep one canonical markets/tracking page.

MEDIUM

28. Forum/footer still carries presale-era navigation

Observed: The forum index continues to show a 'Presale' section containing Support, Win \$100K and Developer Grants, while its blockchain footer is still testnet-heavy.

Action: Update the forum theme/footer separately from the main website. Remove old promo links and add current mainnet/DAO/docs/worker links.

MEDIUM

29. The homepage still contains grammar/brand-polish issues

Observed: Examples include 'for to be Part of the Conversation', inconsistent LightChain/Lightchain naming, duplicated principle headings in crawl output and old-style labels.

Action: Run a copy/style QA pass after factual fixes. Establish one brand spelling, capitalization, terminology and date style.

MEDIUM

30. Old market/media visibility should be refreshed

Observed: The homepage emphasizes crypto-media logos, but the stronger current proof is product/network activity and September development releases.

Action: Keep selected media mentions, but lead with dated, verifiable current-network proof: mainnet, worker models, dApps, governance, Chat-v2, network upgrades and current ecosystem activity.

MEDIUM

31. Trade/support safety language should use canonical links

Observed: The docs correctly warn users to verify contract addresses, but trade/tracker/support routes are scattered across homepage, docs, forum and Linktree.

Action: Create one canonical 'Official Links & Markets' page. All socials, trackers, DEX/CEX routes, contract addresses, explorers and support contacts should point back to it.

VERIFY

32. Kraken and every other exchange logo needs a manual visual sweep

Observed: Search/crawl tools cannot reliably read text embedded inside logo cards or client-rendered carousels. A stale Kraken card may therefore exist even when the HTML text crawl does not expose it.

Action: On desktop and mobile, screenshot every exchange/market section and record each logo + status + destination. Remove any logo with no current exchange-owned evidence. Apply the same test to MEXC, Tapbit, BitMart or any historical applicant/listing partner.

3. Page-by-Page Website Hygiene Checklist

This is the practical sweep the web team can work through. It focuses on what should be removed, relabelled or verified, not just high-level strategy.

Surface	Required QA / change
Homepage hero / nav	Verify all 'soon' labels; remove dead placeholders; mainnet-first APIs; exact current product status.
Trade / markets area	Remove TRADE LCAI ON >> SOON; verify every exchange logo; link active Uniswap/tracker/CEX routes only.
Referral block	Remove public bonus invitation unless referral program is genuinely active.
Metrics	Fix all blank K/M values; add timestamp/fallbacks; hide failed counters.
Community Signals	Replace May/Testnet/liquidity-relative cards with dated September updates.
FAQ	Align AIVM/Pol/token utility with current docs; direct market links to one official markets page.
Footer	Add contact email(s); add CoinGecko if official; mainnet-first explorer/verifier/API; remove stale soon links.
Dashboard	Separate legacy presale/referral history from live ecosystem activity.
/join giveaway	Archive/redirect if finished; publish result date if appropriate.
Blogs / tag pages	No present-tense presale CTA; date/archive old content; noindex stale commercial pages.
Privacy Policy	Current data practices + entity/controller + rights contact + current date/version.
Terms	Current entity/DUNA context + current services/token status; remove future presale delivery text.
Risk Disclosures	Rewrite Ethereum-only/governance-only/nontransferable/1% quorum/token-sale claims.
Whitepaper	Version as historical or publish v2 aligned with live network.
Mainnet Overview	Update 2s slot parameter and all changed network constants.
Governance docs	One current voting flow; archive legacy Ethereum ballot guide if superseded.
Contract docs	Resolve EOA vs Timelock ownership using live on-chain state.
Worker docs	One dispatcher/sortition/gateway status and dated rollout state.
Forum theme/footer	Remove Presale / Win \$100K legacy navigation and update mainnet links.

4. Contact Email / Support Recommendation

Your email point was correct: the current website does not expose a normal contact email in the footer or legal pages. That is especially awkward because the Privacy Policy says users can exercise data rights and 'reach out', but gives no actual address.

What was found: an official Lightchain forum reply on 15 May 2026 told a user to try **team@lightchain.ai**. That is evidence the address was used by the project, but it is not enough to assume it is still the correct public/legal contact today.

Before publishing any email, the team should confirm:

- the mailbox exists and is controlled by the correct current entity/team;
- it is actively monitored;
- who owns replies and expected response time;
- whether privacy/data-rights requests should use a separate address;
- whether security reports should use a dedicated security address or vulnerability form;
- whether media/partnership enquiries should be separated from user support.

Recommended public structure

Purpose	Public label	Recommendation
General	Contact Lightchain	Use team@lightchain.ai only after mailbox ownership/monitoring is verified.
Privacy	Privacy / data requests	Dedicated privacy address or form reviewed by counsel.
Security	Report a security issue	Dedicated security route with responsible-disclosure instructions.
Media / partners	Media & partnerships	Dedicated business contact if the marketing team wants inbound leads.

5. Marketing Readiness

The website should not be treated as ready for paid amplification until the factual/legal cleanup is complete. Agencies and KOLs will repeat whatever the public site tells them, and AI/search systems can index legacy pages just as easily as the new homepage.

Rule: one fact should have one canonical answer. Token purpose, live network status, markets, governance, ownership, worker assignment and legal entity should never require Discord context to explain.

What the site should lead with instead

- Mainnet is live: Chain ID 9200.
- Current AI worker/model capability with live supported-model data.
- Current dApp Hub and product links.
- Current DAO/governance route.
- Current bridge, explorer, IDE and developer docs.
- Recent September releases and network upgrades, each dated.
- Independent audits described accurately, without absolute security claims.

What should be demoted or archived

- Presale participation CTAs, referral acquisition copy and purchase-history marketing.
- Expired giveaway landing pages.
- Indefinite 'coming soon' exchange/product promises.
- Pre-mainnet countdowns and Testnet v2 announcements presented as current signals.
- Unversioned historical whitepaper statements that conflict with deployed behavior.

6. Implementation Plan

Within 48 hours

- Remove/disable stale exchange 'coming soon' cards and the homepage trade-to-chat CTA.
- Remove referral-bonus promotion and stale May/Testnet community cards.
- Fix broken K/M metrics or hide them.
- Add a temporary contact method only after verifying mailbox ownership.
- Add 'Historical / under review' banners to Terms/Risk/Privacy/whitepaper where appropriate until counsel-approved revisions are live.
- Correct 6s vs 2s mainnet slot-time documentation.

Within 7 days

- Publish updated Terms, Risk Disclosures and Privacy Policy with current entity/network facts.
- Reconcile token utility, governance location, quorum basis and contract ownership.
- Audit every 'soon', 'presale', 'giveaway', 'airdrop', 'referral' and 'testnet' string across all first-party web properties.
- Archive/redirect legacy /join and present-tense presale pages.
- Update forum theme/footer separately from lightchain.ai.

Within 30 days

- Publish Whitepaper / Protocol Paper v2.
- Create an Official Links & Markets page that becomes the canonical source for exchanges, DEX, trackers, explorers, contract addresses and support.
- Create a public network-status/facts page that marketing, press and AI systems can cite.
- Introduce a content owner and review date for every evergreen page.

7. Source Register

First-party Lightchain sources were prioritized for project facts. External exchange/audit sources were used only where they were the authoritative source for their own listing/audit information.

Verification note: The Kraken badge is included as a manual visual QA item because the user's browser view reported it, while the text crawler did not expose the logo/card content. Before changing any exchange status, verify the rendered desktop/mobile page and the exchange's own current listing page.
